

Case Study 1 – Serious & Severe Expected ADR

Patient Details

Patient: Male, 58 years

Drug: Warfarin

Reaction: Internal bleeding and blood in urine

Assessment

Patient required immediate hospitalization.

Bleeding is a known side effect of warfarin.

Intensive treatment and monitoring were required.

Classification

Seriousness: Serious

Severity: Severe

Expectedness: Expected

Clinical Impact

The reaction posed a major health risk and required emergency medical management.

Case Study 2 – Non-Serious Mild Expected ADR

Patient Details

Patient: Female, 24 years

Drug: Cetirizine

Reaction: Mild drowsiness

Assessment

No hospitalization required.

Symptoms disappeared after dose adjustment.

Drowsiness is a known effect of cetirizine.

Classification

Seriousness: Non-Serious

Severity: Mild

Expectedness: Expected

Clinical Impact

Minimal impact on patient health and daily activities.

Case Study 3 – Serious Moderate Unexpected ADR

Patient Details

Patient: Male, 40 years

Drug: New Antibiotic Trial Drug

Reaction: Sudden liver enzyme elevation

Assessment

Patient required hospital observation.

Reaction was not listed in safety information.

Condition improved after stopping the medicine.

Classification

Seriousness: Serious

Severity: Moderate

Expectedness: Unexpected

Clinical Impact

The case required medical intervention and suggested a potentially new safety concern.

Case Study 4 – Non-Serious Moderate ADR

Patient Details

Patient: Female, 35 years

Drug: Metformin

Reaction: Nausea and stomach discomfort

Assessment

Symptoms managed with supportive care.

No hospitalization required.

Commonly reported reaction.

Classification

Seriousness: Non-Serious

Severity: Moderate

Expectedness: Expected

Clinical Impact

Temporary discomfort affecting patient compliance with medication.
