

Individual Case Safety Report (ICSR)

1. Patient Information

Patient Initials: R.K.

Age/Gender: 45 years / Male

Weight: 72 kg

Medical History: Hypertension, Type 2 Diabetes Mellitus

Allergy History: No known drug allergies

Occupation: Office Worker

2. Suspected Adverse Drug Reaction (ADR)

Chief Complaint

Patient developed:

Severe skin rash

Itching

Swelling of lips

Difficulty in breathing

Symptoms appeared 3 days after starting a new antibiotic.

3. Suspected Medication Details

Dose	Route	Frequency	Therapy Dates	Indication
625 mg	Oral	Twice Daily	10 May 2026 – 13 May 2026	Respiratory Infection

7. Seriousness Assessment

Criteria	Assessment
Death	No
Life-threatening	Yes
Hospitalization	Yes
Disability	No
Congenital anomaly	No
Other medically important condition	Yes

Final Seriousness Classification

Serious ADR

8. Severity Assessment

Using Modified Hartwig and Siegel Scale:

Level	Description
-------	-------------

Level 4	ADR required hospitalization and treatment
---------	--

Severity Classification

Moderate to Severe

9. Expectedness Assessment

Assessment	Result
Listed in prescribing information?	Yes

Expectedness Classification

Expected ADR

The reaction is a known side effect of beta-lactam antibiotics.

10. Causality Assessment

WHO-UMC Causality Scale

Criteria	Observation
Temporal relationship	Reasonable
Alternative causes	Unlikely
Dechallenge	Positive
Rechallenge	Not done

Final Causality

Probable/Likely

This case represents a serious, expected, probable hypersensitivity adverse drug reaction associated with Amoxicillin-Clavulanic Acid therapy. Prompt withdrawal of the medication and supportive treatment resulted in complete patient recovery. Continuous monitoring and documentation of such reactions are important for ensuring patient safety and improving pharmacovigilance systems.x
